

CSC148 - Balancing Parentheses

We are writing client code and need a function (outside the class) to determine whether the parentheses in an expression are balanced: opening and closing parentheses match and are properly nested inside each other.

1. For four examples, we'll give you a string one character at a time. Your job is to determine whether the string has balanced parentheses or not. *Don't just write down every character without thinking!* Instead, use a stack to keep track of the minimum amount of information you need to solve the problem.

Expression 1:

Expression 2:

Stack

Were the parentheses balanced?

Yes No

Stack

Were the parentheses balanced?

Yes No

Expression 3:

Expression 4:

Stack

Were the parentheses balanced?

Yes No

Stack

Were the parentheses balanced?

Yes No

2. We need a general strategy that will work in all cases. To find it, answer these questions:

(a) What will you do with each character as you receive it?

(b) At the end, how will you know whether the parentheses were balanced?

3. Now implement the function.

```
def is_balanced(line: str) -> bool:
    """Return whether <line> contains balanced parentheses.

    Ignore square and curly brackets.

    >>> is_balanced('(a * (3 + b))')
    True
    >>> is_balanced('(a * (3 + b]]') # Note that the two ']'s don't matter.
    False
    >>> is_balanced('1 + 2(x - y)}') # Note that the '}' doesn't matter.
    True
    >>> is_balanced('3 - (x')
    False
    """
```

4. How would you generalize this code to balance round, square, and curly brackets?
