CSC148 - Considering a different implementation of class Stack

Below is the complete stack class that you saw in the readings.

```
class Stack:
    """A last-in-first-out (LIFO) stack of items.
    Stores data in first-in, last-out order. When removing an item from the
    stack, the most recently-added item is the one that is removed.
    # === Private Attributes ===
         The items stored in the stack. The end of the list represents
          the top of the stack.
    _items: List
    def __init__(self) -> None:
        """Initialize a new empty stack.
        self._items = []
    def is_empty(self) -> bool:
        """ Return whether this stack contains no items.
        >>> s = Stack()
        >>> s.is_empty()
        >>> s.push('hello')
        >>> s.is_empty()
        False
        return self._items == []
    def push(self, item: Any) -> None:
        """Add a new element to the top of this stack.
        self._items.append(item)
    def pop(self) -> Any:
        """Remove and return the element at the top of this stack.
        >>> s = Stack()
        >>> s.push('hello')
        >>> s.push('goodbye')
        >>> s.pop()
        'goodbye'
        HHHH
        return self._items.pop()
```

 (a) What code has to change? (b) Make the changes. 2. What doestrings must change to go along with your code changes? Explain. 3. What changes would be required to the parenthesis balancer code that we worked on in the last lecture in order for it to work with this new version of the class? Explain.
